

The Swedish Economy March 2024 The National Institute of Economic Research (NIER) is a Swedish government agency accountable to the Ministry of Finance. We produce forecasts to support decisions on economic policy in Sweden, analyse economic developments and conduct economic research.

Published four times a year, our report *Konjunkturläget* contains a forecast for the Swedish and global economies as well as more in-depth special analyses of relevant economic topics. *The Swedish Economy* is an English translation of the summary and selected special analyses from *Konjunkturläget*.

All our reports can be downloaded from our website at www.konj.se/english. The forecast reports are available at www.konj.se/english/data-sets.

Preface

Ylva-Hedén Westerdahl, director of the forecasting division, has led the work to produce this forecast. The forecast is based on available statistics published up to the 22^{nd} of March 2024.

Stockholm, March 26, 2024

Summary

The Swedish economy has been operating below capacity for almost a year. The downturn will have a clearer impact on the labour market this year, with unemployment rising to 8.3 per cent. Inflation has dropped back rapidly in recent months and will continue to fall in 2024. The Riksbank will therefore commence a series of interest rate reductions in June, helping the economy to begin a recovery at the end of the year. However, the output gap will not close until 2026. Consumption will be an important driver of the recovery. Lower interest rates and rising real wages mean that household consumption will grow relatively quickly from the fourth quarter this year. Increased spending in areas such as defence means that central government consumption will also grow much faster than normal, as it will also do this year. We estimate fiscal space of around SEK 130 billion for 2025-2028, of which around SEK 40 billion will be used in 2025.

Swedish GDP fell slightly in the fourth quarter of 2023, due mainly to a broad decrease in business investment. This should be seen in the light of non-housing investment having been comparatively strong for some time, and it being normal for investment to decrease when the economy is operating below capacity. Housing investment also continued to fall. Consumers bucked the trend with a relatively strong increase in consumption after cutting back on spending for more than a year (see Diagram 1). The downturn in the economy was also evident in the labour market, with fewer people in work and the jobless rate rising to 8.0 per cent.

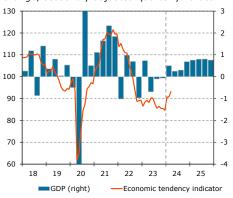

ECONOMY TO BOTTOM OUT THIS YEAR

There is much to suggest that the economy will bottom out this year. For example, many survey-based indicators are on the way up. GDP is expected to start to grow again from the first quarter this year, but it will not be until the end of the year that growth is strong enough for the economy to begin to recover (see Diagram 1).

Consumers have become much less pessimistic in recent months, and the overall confidence indicator has risen rapidly from the very low levels of the past year (see Diagram 2). Consumers' decreased pessimism about their own finances is being driven by an upturn in expectations for the future, whereas their view of the current situation is still deeply negative (see Diagram 3). This growing faith in the future can be attributed partly to inflation heading rapidly back down towards the Riksbank's target rate of 2 per cent (see Diagram 6). This lower inflation means that real wages will start to rise again this year after falling sharply for the past two years. Lower inflation and inflation expectations anchored close to 2 per cent also

mean that the Riksbank is expected to commence a series of reductions in its policy rate in June this year, which will gradually bring down households' mortgage costs. This will help household consumption grow relatively quickly this year and next (see Diagram 2) without constraining savings.

However, there is considerable uncertainty about the future path of inflation and households' propensity to consume. Our forecast assumes that household savings will rise slightly this year and next. There is therefore the possibility that households will spend even more. The consequences of such a situation are reported in an alternative scenario in our full forecast, published in Swedish only. We also present a second alternative scenario looking at the effects on the economy if inflation comes down more slowly than assumed in our forecast.

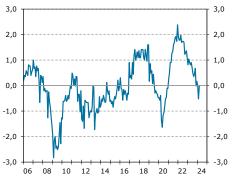

WEAK DEMAND FROM ABROAD TO HOLD BACK SWEDISH **EXPORTS**

Sweden's exports fell slightly in the fourth quarter last year. They will start to grow again from the second quarter this year, but comparatively slowly by historical standards. Manufacturers' export order books have deteriorated rapidly and are now back around normal levels (see Diagram 4). Demand for Swedish export goods will remain weak this year. Exports will therefore make only a marginal contribution to GDP growth in 2024 (see Diagram 5).

The weak demand for Swedish export goods is largely a consequence of developments in the euro area. GDP there stagnated in 2023, but unemployment still fell slightly further and is now at historically low levels. High energy prices and weak export demand weighed on industrial production and exports, while rapid inflation and high interest rates held back household consumption. Several indicators, such as the PMI (see Diagram 7), point to further weak growth in the euro area in the near term. Inflation dropped back rapidly in 2023 (see Diagram 6) and will level off in 2024 at just under 2 per cent. The European Central Bank is therefore expected to begin a series of interest rate reductions around the middle of the year (see Diagram 8). This will gradually stimulate GDP growth, which will pick up somewhat later in the year.

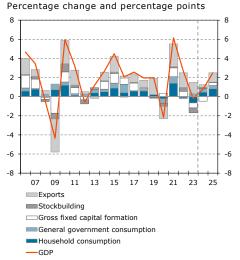

Growth in the US was relatively strong in 2023, and unemployment, as in the euro area, was at historically low levels. Wages have risen rapidly in recent years, fuelling inflation, and the Federal Reserve has raised its policy rate much further than the European Central Bank to rein in the economy (see Diagram 8). These high interest rates mean that GDP growth will slow sharply in the course of this year, and inflation will continue to fall. As in the euro area, the Federal Reserve will therefore start to lower its policy rate around the middle of the year.

LABOUR MARKET TO DETERIORATE FURTHER

The downturn in the Swedish economy impacted the labour market in the second half of last year, with the number of people in work beginning to fall. Monthly data through to February show that the decline in employment continued at the beginning of this year. Several indicators, such as new job openings, redundancy notices and firms' employment plans (see Diagram 9), point in the same direction. The rapid decline in residential construction has led to very weak employment plans in the construction sector. Housing investment will continue to fall this year, and so the sector will make a significant negative contribution to employment growth (see Diagram 10). The service sector, on the other hand, has positive employment plans and is expected to account for the bulk of job growth later this

year and next year as the economy recovers. Meanwhile, the labour force will continue to expand. Taken together, this means that unemployment will rise this year but head gently back down next year (see Table 1).

INFLATION TO FALL FURTHER

Inflation will continue to fall this year even when we exclude the drop in energy prices. CPIF inflation – the change in the consumer price index with a fixed interest rate – is expected to bottom out at 1.2 per cent in the fourth quarter and will also then be well below the Riksbank's target with energy prices excluded (see Diagram 11). The pay deals struck last year mean that wages will continue to rise relatively quickly this year given the weak economy (see Table 1). Firms' labour costs will therefore grow relatively quickly this year, but profitability is currently high by historical standards in many parts of the business sector. This will reduce the need to pass on cost increases to end-customers, which is also harder when demand is weak. Meanwhile, falling import prices will in particular ease the pressure on goods prices, which will start to fall gently later this year and so make a negative contribution to inflation (see Diagram 11). In the second half of this year, CPIF inflation will be propped up mainly by rising prices for services and housing.

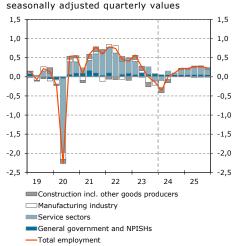

The decline in inflation means that the Riksbank will commence a series of interest rate reductions in June this year to stimulate demand in the economy and prevent inflation from dropping too low. Our forecast has the policy rate falling to 3.0 per cent at the end of this year (see Diagram 12), which is largely in line with market expectations as measured by RIBA futures. Next year, we expect the policy rate to be lowered further to 2.25 per cent, which corresponds to our estimate of the neutral rate.

DEFICITS IN PUBLIC FINANCES AHEAD

Public finances will remain strong this year, with structural net lending slightly above the surplus target and Maastricht debt slightly below the level of the debt anchor.

Increased spending in areas such as defence mean that both consumption and investment in the central government sector will grow comparatively quickly this year and next. In the local government sector, however, weak finances will require some cutbacks, and so consumption growth will be comparatively weak in both years. We estimate fiscal space of around SEK 130 billion for 2025-2028, of which around SEK 40 billion will be used in 2025. Structural net lending will turn from a surplus this year to a deficit next year.

Forecast revisions 2024-2025

The most significant revisions from the December 2023 edition of The Swedish Economy are summarised below (see Table 2).

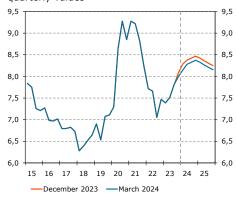

- US GDP growth this year has been revised up 0.9 percentage points to 2.2 per cent, due mainly to much stronger growth in the fourth quarter last year than we anticipated in December.
- Growth in gross fixed capital formation in Sweden this year has been revised down sharply to -2.4 per cent. Nonhousing investment in the business sector was much weaker in the fourth quarter than we assumed in December. Investment growth has also been adjusted down slightly for the first half of this year. The revision is considerable, not least in manufacturing, where the previous strong upswing is now expected to come to an end this year rather than next (see Diagram 13).
- The downward revision of growth in gross fixed capital formation is an important factor in our forecast for GDP growth this year being lowered by 0.2 percentage points to 0.8 per cent.
- Despite this lower GDP growth, the labour market is expected to perform slightly better than we predicted in December. This applies to both hours worked and employment. This means, in turn, that unemployment will rise slightly less far this year than forecast in December and will be lower throughout the forecast period (see Diagram 14).
- CPIF inflation has been revised up slightly for 2024 but down slightly for 2025. These adjustments to our inflation forecast mean that we now expect the policy rate to come down slightly more quickly this year and next than forecast in December, but with the same terminal rate in 2025.
- General government structural net lending this year has been revised down by 0.3 percentage points (see Diagram 15). This is primarily a consequence of higher structural expenditure this year than forecast in December, due chiefly to higher government consumption in relation to potential GDP.

 $^{^1}$ The weights indicate each country or region's purchasing power-adjusted share of world GDP. 2 The table shows some of the countries that the NIER makes forecasts for. The world aggregate is calculated using time-varying purchasing power parity GDP weights from the IMF. 3 KIX weighted GDP is the weighted average of GDP growth in the 32 countries included in the KIX effective krona exchange rate index. 4 Sweden's export market refers to total import demand in the countries to which Sweden exports, each country weighted by its share of Swedish goods exports.

¹The tax-to-GDP ratio is calculated by dividing total taxes, including EU taxes, by GDP. ² Fixed gross investments, inventory investments and acquisition/disposal of land, etc. ³ Technical transfer to households in the form of changes to taxes and/or transfer payments. Refers to the amounts that in the coming years need to be transferred between households and the general government in order to achieve the forecast path for structural net lending. A negative number means a need for austerity measures in the general government, i.e. measures are taken with a negative effect on households' disposable income, and a positive number means room for expansive measures. ⁴ Net lending is calculated as income minus the sum of expenses and transfers to households. ⁵ Primary net lending is calculated as net lending minus net capital income. Net capital income is capital income minus capital expenditures.

¹ Central government's old-age pension contributions. ² Fixed gross investments, inventory investments and acquisition/disposal of land, etc. ³ Technical transfer to households in the form of changes to taxes and/or transfer payments. In this table, central government grants to the local government sector are estimated based on unchanged rules. If these grants turn out to be higher than with unchanged rules, the technical transfer from the central government sector to households will decrease correspondingly, at the same time as the technical transfer from local government to the households will increase correspondingly via smaller increases in local government taxes (or larger transfer payments). The total technical transfer from the general government sector to households, reported in Table A20, is not affected.

 $^{^1}$ Calculated as the difference between expenditure in the scenario and a projection of expenditure using the price- and wage index calculation (the so called pris- och löneomräkning, PLO, in Swedish) 2 Calculated as the difference between expenditure in the scenario and a projection of expenditure based on the development of the base price amount. 3 Calculated as the income supplement needed in the local government sector, at a given municipal tax rate, to finance the expenses in the scenario while simultaneously achieving a surplus (within the accounting framework) and net lending at a level consistent with sound financial management. ⁴Adjusted in the scenario in such a way that the surplus target is reached. ⁵ Per cent of potential GDP.

Note. Every year, the Riksdag makes decisions on expenditure frameworks and revenues for years beyond the budget year. In connection with the budget proposal for 2024, decisions were made regarding the framework for 2025–2026. This framework includes fiscal policy measures related to escalations and de-escalations of various measures. These changes have been taken into account in the calculation of additional fiscal policy measures in NIER's scenario.
