

The Swedish Economy September 2024 The National Institute of Economic Research (NIER) is a Swedish government agency accountable to the Ministry of Finance. We produce forecasts to support decisions on economic policy in Sweden, analyse economic developments and conduct economic research.

Published four times a year, our report *Konjunkturläget* contains a forecast for the Swedish and global economies as well as more in-depth special analyses of relevant economic topics. *The Swedish Economy* is an English translation of the summary and selected special analyses from *Konjunkturläget*.

All our reports can be downloaded from our website at www.konj.se/english. The forecast reports are available at www.konj.se/swedisheconomy and data can be found at www.konj.se/english/datasets.

Preface

Ylva Hedén Westerdahl, director of the forecasting division, has led the work to produce this forecast. The forecast is based on available statistics published up to September 20, 2024.

Stockholm, September 26, 2024

Albin Kainelainen Director-General

Summary

The Swedish economy will weaken further this year, largely because households have chosen to save more and not spend more in response to high inflation and high interest rates. A tentative recovery will begin towards the end of the year, but the output gap will remain negative for longer than anticipated in our June forecast. Low inflation and falling interest rates mean that consumer spending will begin to grow more quickly next year. Lower interest rates will also help investment to pick up after falling both this year and last. The turnaround in the economy means that unemployment will fall over the course of next year. Our forecast assumes that the Riksbank gradually lowers the policy rate to 1.75 per cent next summer. The budget bill for 2025 entails a decline in general government net lending next year to -0.6 per cent of GDP. We estimate fiscal space of SEK 106 billion in the period 2026-2028, or around SEK 35 billion per year, which is about the size of an average budget bill.

Swedish GDP has been weak since the end of 2021, rising and falling from quarter to quarter (see diagram 1). GDP fell slightly in the second quarter this year. Exports performed comparatively well, but there was a broad decline in investment and a slight drop in household consumption. This meant that the output gap widened further. The labour market did not perform as poorly. The number of employed increased somewhat in the second quarter, and unemployment held at 8.3 per cent.

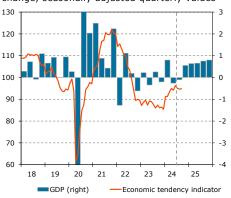

ECONOMY TO BOTTOM OUT IN SECOND HALF OF 2024

There is much to suggest that the economy will bottom out later this year. For example, many survey-based indicators are improving, although the Economic Tendency Indicator measuring sentiment in the economy as a whole is still somewhat lower than normal (see diagram 1). GDP is expected to be more or less unchanged in the third quarter but grow sufficiently in the fourth to commence a tentative recovery.

Swedish households were hit hard by the rise in inflation and interest rates. Large price increases contributed to a drop in real disposable income last year. Rising interest rates and lower real disposable income caused consumers to cut back sharply on spending and save more (see diagram 2). Household consumption continued to fall in the first two quarters this year, but a turnaround is in sight. In the Economic Tendency Survey, the number of consumers reporting a deterioration in their finances over the past 12 months is still higher than normal but has fallen rapidly (see diagram 3). Meanwhile, the percentage of consumers expecting an improvement in their finances over the next 12 months has climbed to historically high levels. Consumers have also become less pessimistic over the course of this year about the risk of becoming unemployed.

Diagram 1 Economic tendency indicator and GDP

Index mean=100, monthly values and percentage change, seasonally adjusted quarterly values

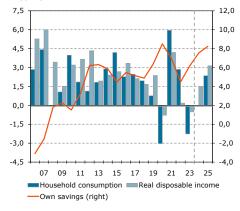

Note: The GDP growth in the second quarter of 2020 was -8.1 percent and 4.8 percent in the third quarter of 2020.

Diagram 2 Household consumption, real disposable income and own savings

Percentage change and per cent of disposable income

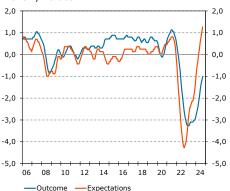

Note: Own savings are defined as total household savings excluding savings in occupational pensions. The measure is put in relation to households' disposable income

Sources: Statistics Sweden and NIER.

Diagram 3 Households view on own economy

Standardised deviations from mean, smoothed monthly values

Note: Outcome - current financial situation of households compared to 12 months ago. Expectations - financial situation of households in 12 months' time.

Source: NIER.

This dawning consumer optimism is a result of inflation dropping back and the Riksbank lowering its policy rate and signalling further reductions. Incoming statistics and indicators suggest that household consumption will increase only marginally in the third quarter this year. After that, however, improving real wages and falling interest rates will enable consumers to step up their spending gradually, and consumption growth will be high by historical standards in the latter part of 2025. Household saving is nevertheless forecast to continue to rise next year (see diagram 2). There is, however, considerable uncertainty about the balance households will strike between spending and saving.

INFLATION TO REMAIN BELOW THE RIKSBANK TARGET

CPIF inflation – the increase in the consumer price index with a fixed interest rate - fell to 1.2 per cent in August. Excluding energy, there was a less pronounced decrease to just over 2 per cent (see diagram 4).

The recent rapid retreat in inflation can be explained partly by prices for a number of commodities (including energy, some metals and agricultural products) having dropped back from previous peaks. Together with a stronger krona, this will contribute to a clear decline in import prices in the second half of this year and next year, putting a damper on production costs in the business sector. On the other hand, wages will grow by 4,0 per cent this year and 3,6 per cent next year, which is comparatively high and will put some pressure on costs. However, profitability is relatively high across much of the business sector, albeit with some variations, and subdued demand means that many firms face fierce competition, making it hard to pass on higher costs. All in all, this means that CPIF inflation is expected to remain well below 2 per cent for the rest of this year and next year (see diagram 4).

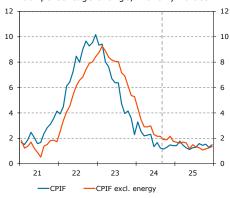

SCOPE FOR THE RIKSBANK TO ACT FASTER

Our forecast assumes that the Riksbank continues to lower the policy rate gradually to 1.75 per cent in mid-2025 (see diagram 5). This is largely in line with market expectations as measured by RIBA futures. The fall in interest rates means that the economy will recover increasingly quickly next year, but the output gap will not close until the latter part of 2026 (see diagram 6). We believe that it would be preferable for the Riksbank to lower the policy rate more quickly in the near term than assumed in our forecast. This would accelerate the economic recovery without pushing inflation above 2 per cent. An alternative scenario using our macro model supports this view.

WEAK DEMAND HOLDING BACK SWEDISH EXPORTS

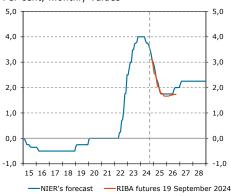

The decline in inflation is not a uniquely Swedish phenomenon but has been more rapid than in many other countries (see diagram 7). Lower inflation has allowed interest rates to be cut in

Diagram 4 Consumer prices Annual percentage change, monthly values

the US and the euro area. For many of Sweden's most important trading partners, in particular the euro area and the key market of Germany, growth will nevertheless remain sluggish this year. This translates into weak growth in Sweden's export market this year. Next year, many of Sweden's most important trading partners will see somewhat stronger GDP growth, and Sweden's export market will grow slightly more quickly, albeit relatively slowly by historical standards.

All in all, this means that Swedish exports will grow comparatively slowly both this year and next. Exports will nevertheless make the greatest contribution to GDP growth in both years (see diagram 8). Investment will continue to make a clear negative contribution this year. As was the case last year, this is due primarily to the sharp decline in housing investment, but housing investment will rise slightly next year. Government investment will also grow comparatively quickly next year, thanks partly to central government construction and infrastructure projects and investments in defence. Investment will therefore make a small positive contribution to GDP growth in 2025. Increased defence spending will also mean that government consumption makes a clear contribution to GDP growth both this year and next.

LABOUR MARKET TURNAROUND IN SIGHT

The weak economy is also evident in the labour market. The number of employed has fallen somewhat since the latter part of last year, and unemployment has climbed to high levels (see diagram 9 and diagram 10). Monthly data through to August and indicators suggest that employment will fall slightly further in the third quarter, and that unemployment will rise slightly further. Once GDP starts to grow again in the fourth quarter, employment will begin to recover. Firms' resource utilisation is currently low, however, which means that the increase in production can to some extent be achieved with existing staffing. Employment growth will therefore be relatively sluggish in the fourth quarter and over the course of next year. It will initially be driven by business services, such as ICT (see diagram 9). Employment will then rise in other parts of the service sector as household spending accelerates next year.

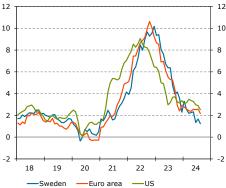

This sluggish employment growth means that unemployment will drop back only slowly to just over 8 per cent at the end of next year (see diagram 10). This is above our estimate of the equilibrium rate of 7.5 per cent at the end of 2025.

GOVERNMENT DEFICIT IN 2025

Public finances will remain strong this year, with structural net lending in line with the surplus target and the Maastricht debt will be slightly below the level of the debt anchor (see diagram 12 and diagram 11). The weak economy means that actual net lending will fall to -1.5 per cent of GDP this year, exacerbated

by central government injecting SEK 25 billion into the Riksbank.

The budget bill for 2025 means that structural net lending will fall to 0 per cent of GDP next year.

We estimate fiscal space of SEK 106 billion in the period 2026-2028, or around SEK 35 billion per year, which approximately corresponds to the size of the fiscal space in an average budget bill.

Forecast revisions 2024–2025

The most significant revisions from the June 2024 edition of The Swedish Economy are summarised below (see Table 2).

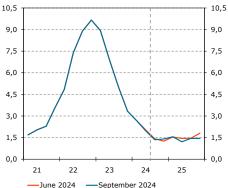

- Growth in household consumption has been revised down by 0.6 percentage points for both 2024 and 2025. The lower level this year can be explained by the combination of a bigger decrease in spending in the first quarter than Statistics Sweden previously calculated, an unexpected further fall in the second quarter, and the outlook for the third and fourth quarters having deteriorated since our June forecast (see diagram 13). The bulk of the change for 2025 can be explained by the much weaker level at the end of 2024 in our present forecast.
- Growth in gross fixed capital formation has also been revised down for both 2024 and 2025. The largest downward revision is for the service sector (excluding housing). As with household consumption, the change in 2025 is due mostly to a weaker level at the end of 2024 than foreseen in June.
- Swedish GDP growth has been revised down by 0.3 percentage points for 2024 and 0.4 percentage points for 2025. This means that the economic downturn is now forecast to be somewhat deeper and more prolonged than anticipated in June. The output gap is now expected to be -1.6 per cent next year, compared with -1.1 per cent in our June forecast.
- These relatively large revisions of GDP growth will have only a limited impact on the labour market. Our forecast for employment growth is only marginally lower when 2024 and 2025 are taken together. This means that resource utilisation in the labour market as measured by the labour market gap is now expected to be -1.4 per cent in 2025, compared with −1.2 per cent in our June forecast.
- The larger output gap and a sharper fall in import prices next year have contributed to a downward revision of CPIF inflation for 2025 to 1.4 per cent (see diagram 14), which can be compared to the forecast of 1,6 percent in June.
- The larger output gap and weaker inflation outlook mean that the Riksbank is expected to lower the policy rate slightly further in 2025 than we anticipated in June (see diagram 15).
