

The Swedish Economy March 2025

NATIONAL INSTITUTE OF ECONOMIC RESEARCH (NIER) FLEMINGGATAN 7, STOCKHOLM REGISTRATOR@KONJ.SE, WWW.KONJ.SE/ENGLISH ISSN 0039-7296 **The National Institute of Economic Research (NIER)** is a Swedish government agency accountable to the Ministry of Finance. We produce forecasts to support decisions on economic policy in Sweden, analyse economic developments and conduct economic research.

Published four times a year, our report *Konjunkturläget* contains a forecast for the Swedish and global economies as well as more in-depth special analyses of relevant economic topics. *The Swedish Economy* is an English translation of the summary and selected special analyses from *Konjunkturläget*.

All our reports can be downloaded from our website at www.konj.se/english. The forecast reports are available at www.konj.se/swedisheconomy and data can be found at www.konj.se/english/data-sets.

Preface

Ylva Hedén Westerdahl, director of the forecasting division, has led the work to produce this forecast. The forecast is based on available statistics published up to March 21, 2025.

Stockholm, March 26, 2025

Albin Kainelainen Director-General

Summary

The Swedish economy is in a recession. Incoming data suggests that economic growth is weak during the first half of the year. High inflation and significant uncertainty about future economic developments hold back household consumption and business investment. Households have high savings initially, and real wages increase this year. As inflation declines, this encourages households to increase consumption more rapidly, becoming a key driver of the recovery that will start during the second half of the year. However, there is considerable uncertainty about when optimism returns, and there is a risk that the weak economic trend persists longer than forecasted. Economic recovery will continue next year, but the recession will persist, and unemployment will remain noticeably high at the end of 2026. CPIF inflation will ease later this year and will be a few tenths lower than the inflation target next year. Consequently, the Riksbank is not expected to change the policy rate this year or next year. The total fiscal space for 2026-2029 is estimated at approximately SEK 170 billion, which will be gradually utilised over the coming four years.

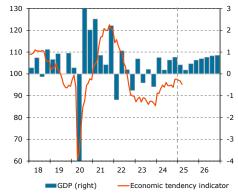

Swedish GDP increased by 0.8 per cent in the fourth quarter of last year, marking the second consecutive quarter of relatively strong growth (see Diagram 1). Household consumption was a key driver of this development in the final quarter of 2024, following a prolonged period of very weak consumption growth (see Diagram 2). The rise in consumption can likely be attributed to higher wages, lower inflation, and the Riksbank's interest rate cuts boosting household confidence. Gross fixed capital formation also rose rapidly, particularly in the service sector. The labour market, however, did not perform as well. The number of employed people decreased slightly for the second consecutive quarter, and unemployment remained largely unchanged.

WEAK FIRST HALF OF 2025

Statistics for the first few months of this year and various indicators point to weakened GDP growth in the first half of the year. After a rapid upturn towards the end of last year, the Economic Tendency Indicator has turned downwards during the initial months of this year (see Diagram 1). A key reason for this is that households have once again become significantly more pessimistic, as reflected in the rapid decline in the confidence indicator (see Diagram 2). This deterioration in household sentiment can likely be linked to inflation rising to an unexpectedly high level at the start of the year and the absence of expectations for further policy rate cuts.

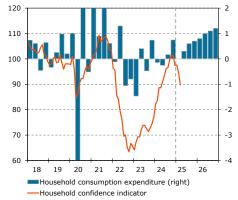

The uncertain global situation is furthermore a likely contributor to increased household pessimism and the slowdown in the Swedish economy. The trade conflict initiated by the new Diagram 1 Economic tendency indicator and GDP

Index mean=100, monthly values and percentage change, seasonally adjusted quarterly values

Note: The GDP growth in the second quarter of 2020 was -8.1 percent and 4.9 percent in the third quarter of 2020. Sources: Statistics Sweden and NIER.

Diagram 2 Household confidence indicator and consumption expenditure Index mean=100, seasonally adjusted monthly values and percentage change, seasonally adjusted quarterly values

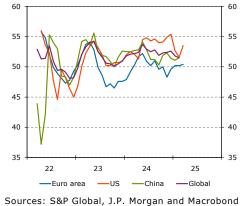

Note. The growth in consumption in constant prices was -9.9 per cent during the second quarter of 2020, 6.2 percent during the third quarter of 2020, 2.8 per cent during the first quarter of 2021 and 4.2 per cent during the third quarter 2021.

Diagram 3 Weighted purchasing manager index in selected countries and regions

Index, monthly values

administration in the United States has created substantial uncertainty. The uncertainty surrounding how the trade conflict will evolve is further dampening investment willingness both in Sweden and internationally.

Short-term leading indicators suggest that global growth remains subdued in the near term. For instance, the Purchasing Managers' Index (PMI) remains just above the growth threshold of 50 in all major economies (see Diagram 3). The overall assessment is that GDP growth remains weak for Sweden's most important trading partners this year, particularly in the euro area (see Diagram 4), which restrains growth in the Swedish export market.

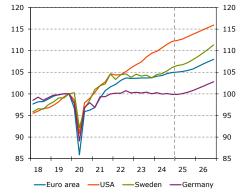

The forecast is based on the assumption that the tariffs already imposed by the United States remain in place and that there will be further tariff increases averaging 10 per cent on all other imported products. In response, the EU is assumed to introduce targeted tariffs on certain American products. Overall, the impact of these tariffs on inflation and growth in both Sweden and the EU as a whole is expected to be limited, while the effects on the United States are likely to be more significant. The extensive defence investments announced by many European countries are not expected to have a significant impact on economic development this year and next year, partly because they take time to implement and partly because the imported content of the acquired materiel is high.

ECONOMIC RECOVERY EXPECTED AFTER SUMMER

A decline in inflation and reduced uncertainty regarding trade conflicts are expected to boost optimism among businesses and households during the second half of the year. However, there remains significant uncertainty about when optimism returns, and there is a risk that the weak economic trend persists longer than forecasted. Households have high initial savings, partly due to precautionary reasons. At the same time, previous interest rate cuts have reduced the incentive to save. Combined with rising real wages, this is expected to result in households increasing consumption relatively rapidly in the second half of the year (see Diagram 2). Investment growth is also set to accelerate in the latter half of the year. Next year, both household consumption and investments will make substantial contributions to GDP growth, which is expected to rise to nearly 3 per cent (see Diagram 5 and Table 1). Despite comparatively strong growth next year, overall resource utilisation in the economy will remain below normal, and the output gap will continue to be negative (see Diagram 6 and Table 1).

UNEMPLOYMENT WILL REMAIN HIGH NEXT YEAR

Labour market signals remain subdued. The sharp increase in unemployment at the start of 2025 was due to more people entering the labour market rather than a decline in employment. Therefore, the rise in unemployment should not be interpreted as a sign of economic weakening. Statistics from the Labour Force Survey (LFS) for January and February indicate that employment increases slightly during the first quarter of this year. Companies' hiring plans have improved somewhat and are now marginally positive (see Diagram 7). At the same time, the number of new redundancy notices has decreased and is now at an approximately normal level. When the economic recovery gains momentum in the second half of the year, it will also be reflected in the labour market, as companies will need to increase staffing levels more rapidly. Additionally, the number of

Diagram 8 Unemployment Per cent of labour force and potential labour

Diagram 9 Contribution to CPIF inflation

employees in the public sector will continue to rise at a normal pace throughout the year. As a result, employment is expected to grow more rapidly in the second half of the year, leading to a decline in unemployment. However, unemployment will remain elevated at the end of 2026 (see Diagram 8), and it will take until 2028 for unemployment to reach the equilibrium level (see Table 1).

THE RIKSBANK HOLDS THE POLICY RATE UNCHANGED

The increase in CPIF inflation in 2025 is partly due to faster rises in goods prices (see Diagram 9), particularly food prices. However, the increase is also attributable to a so-called basket effect. The basket effect stems from a changed consumption pattern that affects inflation with a delay and therefore does not reflect the prevailing inflationary pressure in the economy. The appreciation of the exchange rate at the beginning of the year will gradually have a dampening effect on inflation, which will decrease towards 2 per cent in the second half of the year. At the same time, wage growth is expected to ease somewhat going forward (see Table 1). When the high basket effect from 2025 disappears from the calculation in 2026, CPIF inflation will decrease to below 2 per cent. The economic recovery during 2026 will then add to inflationary pressure, and CPIF inflation will move towards the inflation target during the year.

With inflation above the target at the beginning of this year and expected to be only a few tenths below the target next year, the Riksbank is not expected to make any further reductions in the policy rate either this year or next (see Diagram 11). This development is in line with the Riksbank's own assessment from the end of March, while market expectations measured with RIBA futures suggest a slight increase in the policy rate over the period.

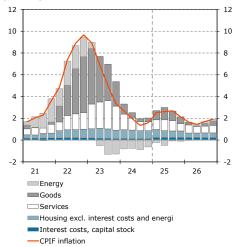

FISCAL SPACE OF 170 BILLION SEK FOR 2026-2029

The financial savings of the public sector strengthens this year but remains negative (see Diagram 10). In structural terms, savings are broadly in line with the current target level for financial savings this year and next.

The government's fiscal space for 2026–2029 is estimated to amount to approximately SEK 170 billion. This fiscal space allows for the implementation of unfunded measures throughout the period.

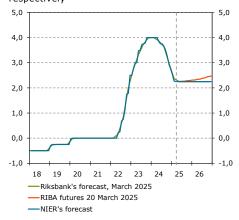

A key issue for fiscal policy going forward is the pace at which defence spending should increase and the extent to which this increase should be funded. Higher defence spending is likely to have a smaller stimulative effect than many other public expenditures, mainly due to a high import content. The risk of fiscal policy counteracting monetary policy is therefore considered low at present, even with a faster and partially unfunded increase in defence spending than assumed in the forecast. However, it is

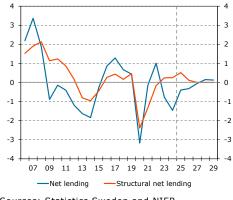

Note. The calculation of the contribution is approximate. Sources: Statistics Sweden and NIER.

important that fiscal policy, in areas other than defence spending, takes into account the combined effects of fiscal policy on inflation and demand.

Forecast revisions 2025–2026

Below is a brief summary of some of the most significant revisions compared with the forecasts in the December 2024 edition of *The Swedish Economy* (see Table 2).

- Swedish GDP growth for 2025 has been revised up by 0.5 percentage points (see Table 2). The upward revision is explained by adjustments to the data and a strong end to 2024, which spills over into the full-year figure for 2025. Quarter by quarter, GDP growth in 2025 is slightly lower than predicted in December.
- Unemployment has been revised up by 0.4 percentage points for both 2025 and 2026, despite a marginal upward revision in employment growth. This is explained by an unexpectedly large increase in the labour force at the beginning of 2025, with the higher participation rate expected to persist throughout the forecast period (see Table 2).
- The Swedish krona has strengthened very rapidly at the start of the year (see Diagram 12). This appreciation has led to a substantial downward revision of the forecast for the krona's effective exchange rate index (KIX) for both 2025 and 2026.
- CPIF inflation rose unexpectedly sharply in January this year (see Diagram 13). The significant increase was due partly to higher-than-expected rises in goods prices, especially for certain food items, and partly to a so-called basket effect. The basket effect stems from a changed consumption pattern that impacts inflation with delays. Overall, this has led to an upward revision of CPIF inflation by 0.8 percentage points for the whole of 2025.
- The unexpectedly high CPIF inflation means that the Riksbank is not expected to lower the policy rate further, unlike the December forecast which assumed a further cut to 1.50 per cent (see Diagram 14).
- Public sector financial savings have been significantly revised upwards for both 2025 and 2026 (see Table 2). The upward revision is partly explained by higher GDP growth and an increase in hours worked for 2025, which strengthens public sector revenue.

¹ KIX-weighted GDP and KIX-weighted CPI are aggregates using the Riksbank's KIX weights covering Sweden's 32 most important trading partners² Per cent. ³ At year-end. ⁴ Brent crude, USD per barrel, annual average. ⁵ Change in per cent of GDP the previous year. ⁶ Calendar-adjusted. ⁷ Per cent of labour force. ⁸ The difference between actual and potential hours worked in per cent of potential hours worked. ⁹ The difference between actual and potential GDP. ¹⁰ According to the monthly wage statistics. ¹¹ Index 18 November 1992 = 100. ¹² Per cent of GDP. ¹³ Per cent of potential GDP.

Note: The difference is between the current forecast and the June 2024 forecast. A positive value denotes an upward revision.

¹ The weights indicate each country or region's purchasing power-adjusted share of world GDP. ² The table shows some of the countries that the NIER makes forecasts for. The world aggregate is calculated using time-varying purchasing power parity GDP weights from the IMF. ³ KIX weighted GDP is the weighted average of GDP growth in the 32 countries included in the KIX effective krona exchange rate index using the Riksbank's KIX weights. ⁴ Sweden's export market refers to total import demand in the 32 countries included in the Riksbank's weight system, KIX.
